Questions for Barnett:

HIGH RISK

- Water is leaking from my hot water tank**
Rings or discoloration on the floor can be signs of a leak.
- There's corrosion on the fittings or pipes going into or out of my tank**
Corrosion can make the pipe or fittings look green, white, or rust colored. It has a thick, chalky texture.
- My water heater is 6 years old or older**
Look for the manufacture date printed on a sticker on the tank.

MEDIUM RISK

- I run out of hot water quickly**
Can you take a nice, long, hot shower?
- Discolored water comes out of my faucets**
Is your hot water as clear as your cold water?
- I have less hot water pressure**
Run just cold water and then just hot water out of a faucet. Does the hot water seem to have less pressure?
- My water heater makes unusual noises**
Popping, hammering, screeching, or sizzling can be a problem. An occasional ticking noise is normal.

LOW RISK

- My water heater temperature dial is set higher than "medium"**
A water heater set to "high" is inefficient. It's not risky, it's just expensive.

Maintenance You Should Be Doing on Your Hot Water Heater

- ▶ Flush the tank every year
